System Requirements & Architecture for Custom ERP and Sales App

Client Industry	Medical Device Import & Distribution
Project Type	Web-based Admin ERP + Mobile App for Field Sales
Current System	"Hisabpati" (Subscription-based, inadequate for complex needs)

1. Project Overview & Scope

The client requires a fully customized ERP solution paired with a mobile application to manage the end-to-end lifecycle of medical device imports (from China to Bangladesh) and local distribution. The system will act as a centralized hub for accounting, sales tracking, inventory management, and role-based data access.

2. Key Technical & Functional Requirements

A. Multi-Company Architecture (Multi-tenant)

- The system must be hosted on the client's own domain and server.
- Multi-business instances:** Must support multiple business profiles under the same platform.
- Data Duplication/Separation:** Needs a feature to run parallel company ledgers (e.g., Company A for real operational metrics, Company B with inflated sales data tailored for bank loans and financial presentations).

B. Role-Based Access Control (RBAC) & Privacy

- Distinct user roles with specific permissions: Admin (Head Office), CEO, Managers, and Field Sales.
- Edit Permissions:** Strictly limited to the main Admin. No field users or managers can edit finalized data.
- Toggle-based Access:** The Admin panel must have granular toggle switches for each user to enable/disable specific views (e.g., "View Invoices", "View Only Own Invoices").
- Sales Privacy:** Field sales representatives must *only* see inventory and their own generated invoices. They cannot view company-wide sales, other agents' invoices, or the core purchasing costs to prevent internal disputes regarding profit margins.

Costing & Inventory Management:

The software must accurately calculate the "Landed Cost" per item. This includes the initial purchase cost in China, local Chinese transit, ocean freight/shipping, Chittagong Port customs duty/tax/VAT, and truck transport to the Dhaka warehouse. Accurate baseline costing is mandatory to calculate real profit/loss margins.

C. Additional Features

- **GPS Tracking:** Integrated real-time tracking for the mobile app to verify the market presence of field sales representatives.
- **AI Co-pilot Integration:** A simple query interface (e.g., "Which item sold the most last month?") that analyzes the software's database to provide instant management reports.
- **Payment Gateway:** Not required at this phase.

3. Timeline & Next Steps

The client stressed the urgency of migrating from manual ledgers and their current inadequate software. Development should start with a strong foundational architecture.

Action Items

- **Client (Tomorrow):** Will organize and share Excel files detailing the current data structure, item categories, and formulas via WhatsApp.
- **Agency/Developer:** Review the provided Excel data, assess if any pre-built modules ("kaachakachi kora") can expedite development, and outline the technical roadmap for the 3-4 month project timeline.
- **Ongoing:** Post-deployment maintenance (After-Sales Service) is crucial, as the client expects regular support for daily operational issues.
